

Filtering & Cleaning Data

Learn

Study:

- Selecting rows
- Filtering data
- Sorting data
- Missing values
- `isnull()`
- `dropna()`
- `fillna()`
- `sort_values()`

Practical Work

Continue working with:

`motor_data.csv`

Program 1 – Find High Temperature

Find all records where:

Temperature > 70

Display those records.

Program 2 – Find High Current

Find all records where:

Current > 9

Display the records.

Program 3 – Sort the Data

Sort the motor data by:

- Temperature
- Current
- RPM

Try both ascending and descending order.

Program 4 – Missing Data

Check whether the dataset contains missing values.

If there are missing values:

- Identify them.
- Decide how you would handle them.

For example:

Temperature = missing

Possible approaches:

- Remove the record.
- Replace it with an appropriate value.

Important: Don't just remove data without understanding why you are doing it

Small Challenge

Create a program that displays:

Motor Records Above Normal Temperature

and shows all records where the temperature exceeds your chosen threshold.
